
, PTT !(Websocket)

One of the key advantages of using Websocket as a service discovery protocol is that its scalable. When a device is joining the system, the Service Discovery Protocol is responsible for collecting information about the device. For example, it can obtain location information and the device's operating system. This allows the system to support various types of devices. The system can also perform basic system checks as it creates the account for the device. Once this account has been created, the device can enter the service discovery process. This involves the device sending a Get methods, that the system sends back a challenge to the device. The device responds with a special frame called the Handshake frame. The response to the handshake frame is used to establish the connection between the device and the system. This keeps the handshake process short and allows a large number of devices to join the service. If the device accepts the handshake frame, it is assigned a unique identifier from the system. WS!(Websocket) works on top of TCP and other transport protocols to offer the real-time bidirectional communication between client and server. Also, with that being said, WS is designed as a viable replacement to, var socket = new SockJS('!gs-guide-websocket!'); var pollServer = setInterval(function() { socket realtime.subscribe(function(data) { console.log('message received', data.object); }); }, 500); , PTT!(Websocket) The Websocket protocol is a simple extension to HTTP. It allows two-way, full-duplex communication between browser and server over a single TCP connection.

HTTP/1.1 101 Switching Protocols
Upgrade: websocket Connection:
Upgrade Sec-WebSocket-Accept:
3X2clsHy1rvX+vWP4CwG0EEY= The
client receives the 101 Switching
Protocols HTTP response as its
onopen() callback. This indicates
that the client and server are using
WebSocket and that the client must
begin sending and receiving text
data. The client begins with a SEND.
The server responds by sending an
HTTP 101 Switching Protocols

response and a new websocket
handshake: HTTP/1.1 101 Switching
Protocols Upgrade: websocket
Connection: Upgrade Sec-
WebSocket-Accept:
3X2clsHy1rvX+vWP4CwG0EEY= If
the browser has a history of recent
browsing, the client reuses the same
WebSocket connection to transmit
further information, such as a video
stream. If the browser does not have
a history of recent browsing, the
client must use a connection to the
server. It transmits the SEND using a
XMLHttpRequest for the xhr-
streaming transport. ,

PTT!(Websocket) The onclose() event can be fired if the browser's user wishes to close the connection.

In this example, it will be called when the user clicks on the 'x' mark on the right side of the browser.

SockJS supports the WebSocket protocol for communication between browser and server. The full list of supported transport protocols is as follows: Transport
